CARDIAC CATHETERIZATION & CORONARY ANGIOGRAPHY REPORT

PATIENT: Doe, John | MRN: 9028192 | DATE: 2026-03-15
INDICATIONS: 64M presenting with acute inferior STEMI.

PROCEDURE PERFORMED:
1. Right radial catheterization with 6F Glidesheath.
2. Coronary angiography.
3. Primary percutaneous coronary intervention (PCI) to culprit RCA.

HEMODYNAMICS:
Aortic Pressure: 132/78 mmHg. LVEDP: 18 mmHg.

CORONARY ANGIOGRAPHY FINDINGS:
1. Left Main: Normal.
2. LAD: Proximal LAD has mild 30% disease. Mid-LAD has severe 85% calcified stenosis.
3. LCx: Non-obstructive 40% plaque.
4. RCA: Acute 100% mid-RCA occlusion with heavy thrombus. Successfully revascularized with 3.5x28mm Xience

CONCLUSION
1. Successful primary PCI to culprit acute RCA occlusion.
2. Severe residual mid-LAD stenosis; plan for staged PCI to mid-LAD in 4 weeks.
3. Continue DAPT with aspirin and ticagrelor.
